

Magnet is a proprietary biodegradable nutrient availability enhancer that has been researched and agronomically proven to increase yields in over 900 trials and over 40 crops across the world.

Product Description

Magnet is a negatively-charged (anionic), biodegradable amino-acid polymer that is polymerized from L-aspartic acid, a natural amino acid synthesized in plants. Its molecular weight is approximately 5000 g/mol—small enough to remain highly water soluble, but large enough where it cannot be taken up by a plant.

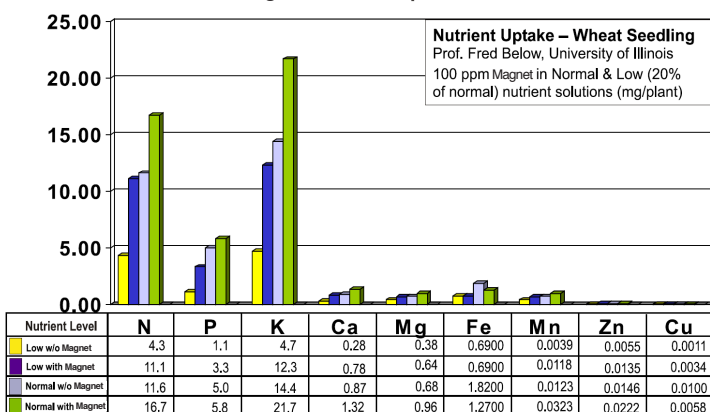

Due to its molecular structure, Magnet has the ability to function as a humectant and attract and retain moisture. The anionic sites on the polymer attract positively-charged ions (cations) and prevent them from forming insoluble complexes with anionic ions and compounds such as phosphates, nitrates, sulfates, chlorides, and bicarbonates. Due to the increase in water-holding capacity along the polymer, the anionic sites can carry a higher solution of nutrients, which allows them to be held at a higher concentration and be more available to the plant. Through this process, Magnet acts as a crystal growth inhibitor that delays the formation of insoluble, unavailable precipitates that form between cations and anions.

Competitive products in the market place purport to work like Magnet. However, those products can complex (or chelate) nutrients too strongly, which causes the product-nutrient complex to precipitate from the soil. This causes the complexing agent to no longer be useful, while also making the complexed nutrient no longer available to the plant. Magnet does not have this issue due its molecular structure. It gently bonds to nutrients, preventing their precipitation and making them more available to the plant. This cycle repeats itself over and over until the biology in the soil slowly degrades the polymer over the course of a growing season. As such, with the addition of Magnet, growers in a variety of growing environments can increase the efficiency of their traditional nutrient management programs.

Product Benefits

- Enhanced nutrient uptake through the increased availability of nutrients.
- Reduces precipitation in irrigation water, and thereby the clogging and plugging of irrigation lines and emitters.
- Flexible delivery methods on granular fertilizer or as a liquid sprayed onto the soil and/or foliage of plants.
- Yields consistent return on investment (ROI).

Magnet Nutrient Uptake

Molecular Weight Comparison

NH₄	Ammonium 18.039 g/mol	Ca	Calcium 40.078 g/mol
Mg	Magnesium 24.305 g/mol	Cu	Copper 63.546 g/mol
Fe	Iron 55.845 g/mol	Mn	Manganese 54.938 g/mol
K	Potassium 39.098 g/mol	Zn	Zinc 65.308 g/mol

What Is A Humectant?

Humectant /ˈ(h)yooˈmektənt/ (noun)

a substance used to retain or preserve moisture

Examples Of Common Fertilizer Precipitates

Calcium Phosphate

Calcium Sulfate

Magnesium Carbonate

Iron(II) Phosphate and Iron (III) Phosphate

Magnet Effects on Root Morphology and Nutrient Uptake

In many crops, the root system of treated plants will have more root branching and longer root hairs, which enables them to make greater use of available nutrients both in the soil and from fertilizer applications. This allows the plants to develop easier and faster. Below is research from Dr. Fred Below's work with Magnet at the University of Illinois. It shows both an increasing in rooting as well as an increase in the uptake of available nutrients.

	Root Hair Length (mm)	Lateral Branches Per Plant
100% Nutrient Strength + 0 PPM Magnet	0.53	220
100% Nutrient Strength + 100 PPM Magnet	0.71*	219
	Seminal Roots (mm)	Lateral Branches Length
100% Nutrient Strength + 0 PPM Magnet	29.1	3.6
100% Nutrient Strength + 100 PPM Magnet	35.2*	4.3*

Dr. F. Below, University of Illinois

*Significant difference at 95% level of probability.

Recommended Use Rates

Vegetable Crops (including artichokes, beans, brassica vegetables, bulb vegetables, carrots, celery, cole crops, cucumbers, leafy greens, legume vegetables, lettuce, melons, onions, peas, peppers, petiole vegetables, potatoes, root and tuber vegetables, spinach, sweet corn, tomatoes)	Apply 16-64 oz per acre when applying fertilizer either in furrow during time of planting, through drip irrigation, overhead irrigation or when applying nutrition in a foliar application.
Field Crops (including alfalfa, cotton, corn, dry beans, forage grasses, hemp, herbs and spices, oil seed, rice, safflower, sorghum, soybeans, sugar cane, sugar beets, and sunflowers)	Apply 16-64 oz per acre when applying fertilizer either in furrow during time of planting, through drip irrigation, overhead irrigation or when applying nutrition in a foliar application.
Berries, Trees & Vine Crops (including citrus, date palm, nuts, pome fruits, stone fruits, blackberries, cranberries, grapes, raspberries, tropical/subtropical fruits)	Apply 32-128 oz per acre via irrigation during a fertilizer application (liquid or granular). Multiple applications of 32 oz can be made for a total of 64-128 oz per acre.
Strawberries	Apply 32 oz per acre in furrow at planting and 32 oz per acre at first bloom. Depending on the variety, successive applications of 32 oz per acre can be applied every 6 weeks throughout the plant's life cycle.
Sod Farms	Apply 16-64 oz per acre when applying fertilizer—either as a preplant or after the sod is established.
Nursery/Greenhouse Crops	Apply a constant feed in order to deliver 25-50 ppm of polymer in a continuous feed irrigation system. If only feeding once a week, apply 100-200 ppm.
Granular Fertilizer	Apply up to 3 quarts per ton. Fertilizer blend should not contain more than 40% urea. If blends contain more than 40% urea, drying amendments may be needed.

Magnet Research and Field Trials

41 Crops-911 Trials-29 States
Updated May 2019

Crop	# Trials	Yield Increase
Alfalfa	3	15.15%
Bell Peppers	6	150 boxes
